## INHIBITORS OF PROTEIN TYROSINE PHOSPHATASE

The present invention comprises small molecular weight, non-peptidic inhibitors of Protein Tyrosine Phosphatase 1 (PTP1) which are useful for the treatment and/or prevention of Non-Insulin Dependent Diabetes Mellitus (NIDDM).

## BACKGROUND OF THE INVENTION

The mechanism of insulin action depends critically upon the phosphorylation of tyrosine residues in several proteins in the insulin signalling cascade. Enzymes that dephosphorylate these proteins, protein tyrosine phosphatases (PTPs), are important negative regulators of insulin action. Therefore, the use of specific PTP inhibitors may therapeutically enhance insulin action.

The insulin resistance that is central to noninsulin-dependent diabetes mellitus (NIDDM) appears to involve a defect in an early process in insulin signal transduction rather than a structural defect in the insulin receptor itself. (J.M. Olefsky, W.T. Garvey, R.R. Henry, D. Brillon, S. Matthai and G.R. Freidenberg, G.R. (1988).) Cellular mechanisms of insulin resistance in non-insulin-dependent (Type II) diabetes. (Am. J. Med. 85: Suppl. 5A, 86-105.) A drug that improved insulin sensitivity would have several advantages over traditional therapy of NIDDM using sulfonylureas, which do not alleviate insulin resistance but instead compensate by increasing insulin secretion.

The binding of insulin to the  $\alpha$ -subunits of the insulin receptor permits the  $\beta$ -subunits to catalyze phosphorylation of target proteins on tyrosine residues. There are 22 tyrosine residues in each insulin receptor  $\beta$ -subunit itself and autophosphorylation of at least 6 of these tyrosines, in 3 distinct domains, is known to be involved in insulin action. (C.R. Kahn (1994) Insulin action, diabetogenes, and the cause of type II diabetes. Diabetes 43: 1066-1084.) Autophosphorylation of Tyr 960 in the juxtamembrane domain is important for receptor internalization and for the interaction of the receptor with downstream signalling molecules such as insulin receptor substrate 1 (IRS-1). (T.J. O'Neill, A. Craparo and T.A. Gustafson (1994) Characterization of an interaction between insulin receptor substrate 1 and the insulin receptor by using the two-hybrid system. Mol. Cell Biol. 14: 6433-6442.) Autophosphorylation of tyrosine residues 1146, 1150 and 1151 in the regulatory domain permits continued tyrosine kinase activity of  $\beta$ -subunits, even after insulin has dissociated from the  $\alpha$ -subunits, and activates the kinase toward other protein substrates. (R. Herrera and O.M. Rosen (1986) Autophosphorylation of the insulin

receptor *in vitro*: designation of phosphorylation sites and correlation with receptor kinase activation. J. Biol. Chem. 261: 11980-11985.) Deletion of autophosphorylation sites at Tyr<sup>1316</sup> and Tyr<sup>1322</sup> in the C-terminal domain attenuates the metabolic actions of insulin, but augments its mitogenic actions. (H. Maegawa, D. McClain, G. Freidenberg, J. Olefsky, M. Napier, T. Lipari, T. Dull, J. Lee, and A. Ullrich (1988) Properties of a human insulin receptor with a COOH-terminal truncation. II. Truncated receptors have normal kinase activity but are defective in signalling metabolic effects. J. Biol. Chem. 263: 8912-8917.) (Y. Takata, N.J.G. Webster, and J.M. Olefsky (1991) Mutation of the two carboxyl-terminal tyrosines results in an insulin receptor with normal metabolic signalling but enhanced mitogenic signalling properties. J. Biol. Chem. 266: 9135-9139.)

Dephosphorylation of these autophosphorylated sites occurs rapidly *in vivo*, suggesting that a protein tyrosine phosphatase (PTPase) is involved in terminating insulin action. A compound that inhibited this PTPase, therefore, should potentiate insulin action. Indeed, vanadate potentiates insulin action, at least in part, by such a mechanism (Y. Schechter (1990). Insulin-mimetic effects of vanadate. Possible implications for future treatment of diabetes. Diabetes 39: 1-5.) The PTPase(s) that act on the insulin receptor, however, has not been identified definitively.

It has been estimated that the human genome encodes as many as 500 PTP enzymes (T. Hunter (1995) Protein kinases and phosphatases: The Yin and Yang of protein phosphorylation and signalling. Cell 80:225-236), but less than 100 have been identified and have been grouped into 4 sub-families (E.A. Fauman and M.A. Saper (1996) Structure and function of the protein tyrosine phosphatases. Trends Biochem. Sci. 21:413-417.) Members of the tyrosine-specific PTP sub-family are further divided into the receptor PTPases (such as CD45 and LAR) which typically have a large variable extracellular domain, a single transmembrane spanning region, and two intracellular phosphatase catalytic domains and the non-receptor PTPases. This latter group includes PTP that resemble PTP1. (D.A. Pot and J.E. Dixon (1992) A thousand and two protein tyrosine phosphatases. Biochim. Biophys. Acta 1136: 35-43.) There is data to support the proposition that the insulin receptor PTPase may be PTP1-like. For instance, an insulin-dependent association of PTP1 with insulin receptors has been described. (D. Bandyopadhyay, A. Kursari, K.A. Kenner, F. Liu, J. Chernoff, T.A. Gustafson, J. Kusari (1997) Protein-tyrosine phosphatase 1B complexes with the insulin receptor *in vivo* and is tyrosine-phosphorylated in the presence of insulin. J. Biol. Chem. 272: 1639-1645; and L.

Seely, et al. (1996) Protein tyrosine phosphatase 1B interacts with the activated insulin receptor. Diabetes 45:1379.) Furthermore, PTP1 dephosphorylates purified insulin receptors sequentially in the order observed *in vivo* (i.e., Tyr<sup>1150</sup> = Tyr<sup>1151</sup> > Tyr<sup>1146</sup>), (C. Ramachandran, R. Aebersold, N. Tonks and D.A. Pot (1992) Sequential dephosphorylation of a multiply phosphorylated insulin receptor peptide by protein tyrosine phosphatases. Biochemistry 31: 4232-4238) and insulin acutely increases PTP1 mRNA in hepatoma cells. (N. Hashimoto and B.J. Goldstein (1992) Differential regulation of mRNAs encoding three protein-tyrosine phosphatases by insulin and activation of protein kinase C. Biochem. Biophys. Res. Commun. 188: 1305-1311.) Insulin resistance induced in Rat 1 fibroblasts by high glucose (27 mM) is preceded by an approximate doubling of cytosolic PTP1 activity that is blocked by the insulin-sensitizer, pioglitazone. (H. Maegawa, R. Ide, M. Hasegawa, S. Ugi, K. Egawa, M. Iwanishi, R. Kikkawa, Y. Shigeta, and A. Kashiwagi (1995) Thiazolidinedione derivatives ameliorate high glucose-induced insulin resistance via the normalization of protein tyrosine phosphatase activities. J. Biol. Chem. 270: 7724-7730.) Thus, a specific inhibitor of PTP1 could be used to potentiate insulin action. While there are no known small molecules that specifically inhibit PTP1, it was found that osmotic loading of hepatoma cells with neutralizing antibodies against PTP1b (the human homologue of rat PTP1) resulted in increased autophosphorylation of insulin receptors and phosphorylation of IRS-1 in response to insulin. (F. Ahmad, P.-M. Li, J. Meyerovitch, and B.J. Goldstein (1995) Osmotic loading of neutralizing antibodies demonstrates a role for PTPase 1B in negative regulation of the insulin signalling pathway. Diabetes 44: Suppl. 1 104A.) See also B.J. Goldstein (1993) Regulation of insulin receptor signaling by protein-tyrosine dephosphorylation. Receptor 3: 1-15.)

wherein  $R^5$  is  $-\text{H}$ ;

wherein the configuration of the chiral center(s) is (S).

The compounds of the present invention are named according to the IUPAC or CAS nomenclature system.

The carbon atoms content of various hydrocarbon-containing moieties is indicated by a prefix designating the minimum and maximum number of carbon atoms in the moiety, i.e., the prefix  $\text{C}_1\text{-C}_j$  indicates a moiety of the integer "i" to the integer "j" carbon atoms, inclusive. Thus, for example,  $\text{C}_1\text{-C}_3$  alkyl refers to alkyl of one to three carbon atoms, inclusive, or methyl, ethyl, propyl, and isopropyl, straight and branched forms thereof.

Also, the carbon atom content of various hydrocarbon-containing moieties of the present invention may be indicated by a subscripted integer representing the number of carbon and hydrogen atoms in the moiety, e.g., " $\text{C}_n\text{H}_{2n}$ " indicates a moiety of the integer "n" carbon atoms, inclusive, and the integer " $2n$ " hydrogen atoms, inclusive. Thus, for

example, " $C_nH_{2n}$ " wherein n is one to three carbon atoms, inclusive, and two to six hydrogen atoms, inclusive, or methyl, ethyl, propyl and isopropyl, and all isomeric, straight and branched forms thereof.

5 Examples of alkyl of one to nine carbon atoms, inclusive, are methyl, ethyl, propyl, butyl, pentyl, hexyl, heptyl, octyl, and nonyl, and all isomeric forms thereof and straight and branched forms thereof.

Examples of alkenyl of one to five carbon atoms, inclusive, are ethenyl, propenyl, butenyl, pentenyl, all isomeric forms thereof, and straight and branched forms thereof.

10 By "halo" is meant the typical halogen atoms, such as fluorine, chlorine, bromine, and iodine.

The present invention encompasses all possible combinations of configurations at each of the possible chiral centers. The preferred configuration for the chiral center depicted in formula I is (S), and the preferred configuration for the chiral center present in  $R^2$  (d and e) is (S).

15 The compounds of formulae I and II of the present invention are prepared as described in the Charts, Preparations and Examples below, or are prepared by methods analogous thereto, which are readily known and available to one of ordinary skill in the art of organic synthesis.

#### CHART A

20 Commercially available tyrosine benzyl ester A-1 is acylated with monomethyl succinate under standard amide coupling conditions employing 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (EDC) as the coupling reagent (Tet. Lett. 1993, 34:7685) to afford A-2. Alkylation of the phenol is effected with diethylchloromalonate in acetone with potassium carbonate as catalyst, conditions analogous to those previously  
25 described for alkylation of phenols (J. Am. Chem. Soc. 1951, 73:872). Standard hydrogenolysis of the benzyl ester A-3 affords A-4, which is then acylated with various amines ( $R^3NH_2$ ) under the influence of EDC. The target acids A-5 are obtained by saponification.

#### CHART B

30 Commercially available Cbz-tyrosine (B-1) is coupled with n-pentylamine under standard EDC conditions, affording amide B-2. Alkylation of the phenol as described in Chart A gives ether B-3, which is then hydrogenolytically deprotected to obtain amine B-4,

isolated as the corresponding HCl salt. Acylation of the free amine with various carboxylic acids  $R^2COOH$  is accomplished with EDC. Final saponification with dilute lithium hydroxide followed by acidification gives the sparingly soluble malonic acids B-5.

## CHART C

5       Amine hydrochloride B-4 (from Chart B) is acylated with various isocyanates in the presence of triethylamine in methylene chloride to afford the corresponding urethanes. Saponification of the esters then provides the acids C-1.

## CHART D

10       Amine B-4 (from Chart B) is converted to the corresponding isocyanate D-1 by reaction with diphosgene and Proton Sponge at 0 C (J. Org. Chem. 1996, 61:3883). Addition of N-benzylglycine ethyl ester followed by saponification then affords the desired urethane triacid D-2.

## CHART E

15       Commercially available Boc-(L)-tyrosine E-1 is coupled with n-pentylamine, as described for Chart B, to give E-2. Preferred methods of preparation are depicted in Charts A, B, BB, Q and R.

The present invention provides for compounds of formulae I and II or pharmacologically acceptable salts and/or hydrates thereof. Pharmacologically acceptable salts refers to  
15 those salts which would be readily apparent to a manufacturing pharmaceutical chemist to be equivalent to the parent compound in properties such as formulation, stability, patient acceptance and bioavailability. Examples of salts of the compounds of formula I include lithium, sodium and potassium.

Where R<sup>5</sup> is other than H, the compounds would not be expected to have intrinsic  
20 activity, but would be expected to possess activity *in vivo* following hydrolysis by non-specific esterases to the corresponding carboxylic acids.

The compounds of the present invention are useful for treating patients with noninsulin-dependent diabetes mellitus (NIDDM) and related diseases. For this indication, these compounds may be administered by oral, intranasal, transdermal, subcutaneous and  
25 parenteral (including intramuscular and intravenous) routes in doses of 0.1 mg to 1000 mg/kg of body weight per day.

Those skilled in the art would know how to formulate the compounds of this invention into appropriate pharmaceutical dosage forms. Examples of the dosage forms include oral formulations, such as tablets or capsules, or parenteral formulations, such as  
30 sterile solutions.

When the compounds in this invention are administered orally, an effective amount is from about 0.1 mg to 100 mg per kg of body weight per day. Either solid or fluid dosage forms can be prepared for oral administration. Solid compositions, such as compressed

tablets, are prepared by mixing the compounds of this invention with conventional ingredients such as talc, magnesium stearate, dicalcium phosphate, magnesium aluminum silicate, calcium sulfate, starch, lactose, acacia, methyl cellulose, or functionally similar pharmaceutical diluents and carriers. Capsules are prepared by mixing the compounds of this invention with an inert pharmaceutical diluent and placing the mixture into an appropriately sized hard gelatin capsule. Soft gelatin capsules are prepared by machine encapsulation of a slurry of the compounds of this invention with an acceptable inert oil such as vegetable oil or light liquid petrolatum.

Syrups are prepared by dissolving the compounds of this invention in an aqueous vehicle and adding sugar, aromatic flavoring agents and preservatives. Elixirs are prepared using a hydroalcoholic vehicle such as ethanol, suitable sweeteners such as sugar or saccharin and an aromatic flavoring agent. Suspensions are prepared with an aqueous vehicle and a suspending agent such as acacia, tragacanth, or methyl cellulose.

When the compounds of this invention are administered parenterally, they can be given by injection or by intravenous infusion. An effective amount is from about 0.1 mg to 100 mg per kg of body weight per day. Parenteral solutions are prepared by dissolving the compounds of this invention in aqueous vehicle and filter sterilizing the solution before placing in a suitable sealable vial or ampule. Parenteral suspensions are prepared in substantially the same way except a sterile suspension vehicle is used and the compounds of this invention are sterilized with ethylene oxide or suitable gas before it is suspended in the vehicle.

The exact route of administration, dose, or frequency of administration would be readily determined by those skilled in the art and is dependant on the age, weight, general physical condition, or other clinical symptoms specific to the patient to be treated.

The utility of representative compounds of the present invention has been demonstrated in the biological assays described below:

**PTP1 Assays:** A construct, which consisted of a C-terminal truncation of rat PTP1 (amino acid residues 1-322) (cloned from a rat brain library) with an N-terminal glutathione S-transferase (GST) tag and an adjacent thrombin cleavage site, was inserted into vector plasmid pGEX-2T and transformed into E.coli strain TG-1 under the control of a lac promoter ( K. L. Guan and J. E. Dixon (1991) Eukaryotic proteins expressed in Escherichia coli: an improved thrombin cleavage and purification procedure of fusion proteins with glutathione S-transferase. *Analyt. Biochem.* 192: 262-267). The GST-fusion protein was

purified on a glutathione agarose affinity column, the GST tag was cleaved with thrombin, and the active enzyme was recovered for use in an assay to identify PTP inhibitors.

The equivalent construct of human PTP1B (amino acid residues 1-321) (cloned from a human placental library), without the GST tag and thrombin cleavage site, was inserted into a pMB replicon and transformed into *E. coli* BL21(DE3), a strain containing a chromosomal copy of the gene for T7 RNA polymerase under control of a lacUV5 promoter. Expression of PTP1B was induced with isopropyl thiogalactose and the soluble protein was purified by ion exchange, hydrophobic interaction and gel exclusion chromatography for use in the assay to identify PTP inhibitors.

PTP1 activity is measured using either p-nitrophenol phosphate (pNPP) or a triphosphopeptide (that matches residues 1142 through 1153 of the  $\beta$ -subunit and the insulin receptor) as substrate in a 96-well microtiter plate format. An assay pH of 7.2 is used for standard assays (measured  $A_{405}=9800$  at pH 7.2).

Human PTP1B, which is highly homologous to rat PTP1, was assayed exactly as described above for PTP1. The PTP1 inhibitors described here also inhibit PTP1B with similar or identical potencies.

Standard assays are conducted at room temperature in a total volume of 0.2 ml that contains Hepes buffer (50 mM, pH 7.2), NaCl (50 mM), EDTA (1 mM), DTT (1 mM), bovine serum albumin (1 mg/ml), pNPP (1 mM) and PTP1 (35 ng/ml). Compounds (2  $\mu$ l of 10 mM solutions) are pipetted into wells of microtiter plates followed by 198  $\mu$ l of premixed reaction mix (with PTP1 and pNPP added immediately before use). The rate of change in  $A_{405}$  is recorded for 60 min. Two wells on each plate contain DMSO controls and two wells contain sodium orthovanadate (1 mM) which inhibits PTP1-catalyzed hydrolysis of pNPP completely. Data are expressed as percent inhibition relative to the average of the DMSO controls measured on the same microtiter plate.

When triphosphopeptide<sup>1142-1153</sup> is used as substrate, the rate of release of inorganic phosphate is measured using a Malachite Green/phosphomolybdate reaction (A.A. Baykov, O.A. Evtushenko, and S.M. Avaeva (1988) A Malachite Green procedure for orthophosphate determination and its use in alkaline phosphatase-based enzyme immunoassay. *Anal. Biochem.* 171: 266-270.) in a microtiter plate format. Standard assays are conducted at room temperature in a total volume of 50  $\mu$ l that contains Hepes buffer (50 mM, pH 7.2), NaCl (50 mM), EDTA (1mM), DTT (1mM), bovine serum albumin

(1mg/ml), triphosphopeptide<sup>1142-1153</sup> (200  $\mu$ M) and PTP1 (87 ng/ml). Reactions are terminated with the addition of 0.15 ml of Malachite Green/ ammonium molybdate reagent [10ml Malachite Green (0.44 g in 6N H<sub>2</sub>SO<sub>4</sub>), 2.5 ml ammonium molybdate (7.5% w/v), 0.2 ml Tween 20 (11% w/v)] that is diluted with 8 parts of water immediately before use, and after 1 h absorbance at 650 nm is measured. The phosphate assay is calibrated using either KH<sub>2</sub>PO<sub>4</sub> or pNPP (after ashing with Mg(NO<sub>3</sub>)<sub>2</sub>) which gives essentially identical standard curves. The phosphate assay is useful in the range of 1 to 10 nmol P<sub>i</sub>.

The % inhibition of pNPP-hydrolysis by compounds of the present invention are listed in Table 1 and 2 below.

#### GENERAL PROCEDURE FOR THE PREPARATION OF BB-4 (Chart BB):

Where R6 is t-butyloxycarbonyl (Boc), the Boc group is removed with HCl/acetic acid or HCl/dioxane, and the resulting amine is acylated with the appropriate acid chloride, isocyanate, sulfonyl chloride, or carboxylic acid via standard procedures. Final saponification (as described for BB-2) affords the diacids BB-4.

EXAMPLES 80-##: (General Synthesis of R-1, R-2, R-3 and R-4, Chart R)

GENERAL PREPARATION OF R-1: Q-4 (0.50 g, 1.0 mmol) was dissolved in a 4 M solution of HCl in dioxane (5 mL). Stirred at room temperature for 2 h. The solvent was removed under reduced pressure. The residue was dissolved in  $CH_2Cl_2$  (5 mL) and triethylamine (0.43 mL, 3.1 mmol), and N-(tert-Butoxycarbonyl)-L-phenylalanine (0.28 g, 1.0 mmol) was added. After the mixture was cooled to 0°C, EDC (0.20 g, 1.0 mmol) and HOBT (0.14 g, 1.0 mmol) was added. The mixture was warmed to room temperature and stirred overnight. The mixture was partitioned between EtOAc and 1 M HCl. The organic phase was washed with sat.  $NaHCO_3$ , sat. NaCl and dried ( $MgSO_4$ ) and concentrated to a glassy solid (0.54 g). The residue was purified by flash chromatography (40 g  $SiO_2$ , 60% EtOAc/heptane) to obtain 0.42 g (67%) of R-1 (R =  $PhCH_2$ ) as a white powder. PREPARATION OF S-2: To a suspension of N-(tert-Butoxycarbonyl)tyramine (S-1, 0.20 g, 0.84 mmol) and  $K_2CO_3$  (0.23 g, 1.7 mmol) in acetone (3 mL) was added diethyl chloromalonate (0.27 mL, 1.7 mmol). The mixture was stirred vigorously at room temperature for 24 h. The mixture was partitioned between EtOAc and  $H_2O$ . The organic phase was washed with sat. NaCl and dried ( $MgSO_4$ ). After the solvent was removed, the residue was purified by flash chromatography (45 g  $SiO_2$ , 3% EtOAc/ $CH_2Cl_2$ ) to provide 0.24 g of S-2 as a colorless oil.

$^1H$  NMR ( $CDCl_3$ )  $\delta$  7.11 (d, 2 H), 6.90 (d, 2 H), 5.16 (s, 1 H), 4.51 (br s, 1 H), 4.32 (m, 4 H), 3.33 (q, 2 H), 2.73 (t, 2 H), 1.42 (s, 9 H), 1.30 (t, 6 H); MS (ESI-) for  $C_{20}H_{29}NO_7$   $m/z$  394 (M-H).

PREPARATION OF S-3: S-2 (239 mg, 0.6 mmol) was dissolved in 1 M HCl / acetic acid (4 mL) and stirred at room temperature for 4 h. The solvent was removed under reduced pressure. The residue was dissolved in  $CH_2Cl_2$  (2 mL), and triethylamine (0.25 mL, 1.8 mmol) and Boc-p-Bz-Phe-OH (222 mg, 0.60 mmol) was added. The mixture was cooled to  $0^\circ C$ , and EDC (115 mg, 0.6 mmol) and HOBT (81 mg, 0.6 mmol) was added. The mixture was warmed to room temperature and stirred overnight. The mixture was partitioned between EtOAc and 1 M HCl. The organic phase was washed with sat.  $NaHCO_3$ , sat. NaCl, and dried ( $MgSO_4$ ). After the solvent was removed under reduced pressure, the residue was purified by flash chromatography (25 g  $SiO_2$ , 15% EtOAc/ $CH_2Cl_2$ ) to provide 108 mg of S-3 as a colorless glass.

$^1H$  NMR ( $CDCl_3$ )  $\delta$  7.76 (t, 4 H), 7.59 (t, 1 H), 7.46 (t, 2 H), 7.31 (d, 2 H), 7.01 (d, 2 H), 6.87 (d, 2 H), 5.90 (br s, 1 H), 5.16 (s, 1 H), 4.95 (br s, 1 H), 4.30 (q, 4 H), 3.40 (m, 2 H), 3.12 (m, 2 H), 2.66 (m, 2 H), 1.40 (s, 9 H), 1.30 (t, 6 H); MS (ESI-) for  $C_{36}H_{42}N_2O_9$   $m/z$  645 (M-H).

PREPARATION OF S-4: S-3 (108 mg, 0.17 mmol) was dissolved in 1 M HCl / acetic acid (2 mL) and stirred at room temperature for 3 h. The solvent was removed under reduced pressure. The residue was dissolved in  $CH_2Cl_2$  (2 mL) and triethylamine (70  $\mu L$ , 0.51 mmol). The mixture was cooled to  $0^\circ C$ , and succinic anhydride (17 mg, 0.17 mmol) was added. The mixture was warmed to room temperature and stirred overnight. The mixture was partitioned between EtOAc and 1 M HCl. The organic phase was washed with sat. NaCl, dried ( $MgSO_4$ ), and concentrated. The residue was dissolved in THF (3 mL), and a solution of  $LiOH \cdot H_2O$  (28 mg, 0.68 mmol) in  $H_2O$  (1 mL) was added. The mixture was stirred at room temperature for 3 h. The mixture was acidified (1 M HCl) and

extracted with EtOAc. The organic phase was washed sat. NaCl and dried ( $\text{MgSO}_4$ ). The solvent was removed *in vacuo* to provide 89 mg of S-4 as an off-white solid.

EXAMPLE 126: 2-(carboxymethoxy)-5-[(2S)-2-({[(dibenzylamino)carbonyl]amino}-3-oxo-3-(pentylamino)propyl]benzoic acid

Prepared by a procedure analogous to that described for Example 10 (Chart D), using Q-4 as a starting material instead of B-4 as follows. Q-4 (54 mg, 0.11 mmole) was dissolved in 4 M HCl/dioxane (1 mL) and stirred at room temp. for 1 h. The solution was concentrated in vacuo, and the resulting residue was taken up in dry THF (2 mL). To the mixture was added triethylamine (47  $\mu\text{L}$ , 0.34 mmol), and the reaction was cooled to 0  $^\circ\text{C}$  before the addition of diphosgene (7  $\mu\text{L}$ , 0.06 mmol). The reaction was stirred at 0  $^\circ\text{C}$  for 15 minutes before the addition of dibenzylamine (29  $\mu\text{L}$ , 0.15 mmol). Stirring was continued at room temperature for 3 h, followed by the addition of 2.5 M aq LiOH (0.6 mL). The mixture was stirred vigorously for 2 h, at which point MS analysis indicated saponification was complete. The reaction was acidified with 1 M HCl (3 mL), saturated with solid NaCl, and extracted with ethyl acetate. Drying of the extracts over  $\text{MgSO}_4$  and

concentration in vacuo left a glass (67 mg). The crude material was sonicated with  $\text{CH}_2\text{Cl}_2$  (20 mL) for 30 min, diluted with hexane (approx. 5 mL), and allowed to stand at room temperature for 1 h, affording a white powder (43 mg, 68% overall).  $^1\text{H}$  NMR ( $\text{DMSO}-d_6$ )  $\delta$  7.82 (t,  $J = 7$  Hz, 1 H), 7.62 (bs, 1 H), 7.15-7.3 (m, 7 H), 7.06 (d,  $J = 7$  Hz, 4 H), 6.83 (d,  $J = 9$  Hz, 1 H), 6.54 (d,  $J = 7$  Hz, 1 H), 4.71 (s, 2 H), 4.35 (m, 1 H), 4.35, 4.25 (ABq,  $J = 16$  Hz, 4 H), 2.7-3.1 (m, 4 H), 1.1-1.4 (m, 6 H), 0.84 (t,  $J = 7$  Hz, 3 H); IR (mull) 3289 (b), 3088, 3064, 3030, 1735 (s), 1614 (s), 1585 (s), 1536 (s), 1496 (s), 1438 (s), 1340, 1301, 1247 (s), 1153, 700,  $\text{cm}^{-1}$ .

A solution of R-1 (R = (S)- $\text{CH}_2\text{Ph}$ ) 0.5 g, 0.8 mmol) and 4N HCl/dioxane (20 mL) was stirred at room temp for 1.5 h. The reaction was concentrated to dryness in vacuo, and the resulting residue was taken up in DMF (50 mL). To the solution was added sequentially diisopropylethylamine (1.03 g, 0.8 mmol), 1,2,4-triazole-5-ylthioacetic acid (Drysdale et al,

*J. Med. Chem.* 1992, 35, 2573)(159 mg, 1 mmol), HOBT monohydrate (135 mg, 1 mmol) and EDC hydrochloride (153 mg, 0.8 mmol). The mixture was stirred overnight at room temp. Solvent was removed in vacuo, and the residue was partitioned taken up in water and extracted with ethyl acetate. The organic extracts were dried over  $\text{MgSO}_4$  and concentrated in vacuo. The residue was triturated with ether and dried again in vacuo, leaving the crude diester (190 mg) as a white solid. The diester was saponified by dissolving in DMF (10 mL) and adding 5.0 mL of 1.0 N aq NaOH. After stirring for 2 h, the reaction was neutralized by the addition of 1.0 N aq HCl (5.0 mL). The solvent was removed in vacuo, and the residue was taken up in water. The insoluble solid was filtered, air-dried and washed with ether, affording the title compound (136 mg) as an off-white solid after drying in vacuo.  $^1\text{H}$  NMR ( $\text{DMSO}-d_6$ )  $\delta$  8.37 (bs, 1 H), 8.23 (d,  $J = 8$  Hz, 1 H), 8.14 (d,  $J = 8$  Hz, 1 H), 7.81 (bt, 1 H), 7.43 (bs, 1 H), 7.25 (bd,  $J = 7$  Hz, 1 H), 7.1 (m, 5 H), 7.01 (d,  $J = 7$  Hz, 1 H), 4.56 (bs, 2 H), 4.45 (m, 1 H), 4.37 (m, 1 H), 3.81, 3.72 (ABq,  $J = 15$  Hz, 2 H), 2.8-3.1 (m, 4 H), 2.6-2.8 (m, 2 H), 1.1-1.4 (m, 6 H), 0.82 (t,  $J = 7$  Hz, 3 H); MS (ESI-) for  $\text{C}_{30}\text{H}_{36}\text{N}_6\text{O}_8\text{S}$   $m/z$  639.2 (M-H) $^-$ .

PREPARATION OF X-1: 3-Iodo-L-tyrosine (5.0 g, 16.3 mmol) was suspended in benzyl alcohol (100 mL) and at 0 °C, thionyl chloride (20 mL) was added dropwise over a 20-min period. The temperature was raised to 80 °C and HCl (g) started to evolve. The reaction mixture became yellow turbid and turned to clear colorless after 30 min. After 8 h of heating, the mixture was stirred overnight at ambient temperature. Dry diethyl ether (150 mL) was added and the flask was stored overnight at -10 °C. The white product was collected on a glass-sintered funnel and dried (1.91 g). An additional amount of 2.65 g (product/ start. mat. 3:1) was obtained after the addition of i-hexane and storage at -10 °C. The combined material was taken up in 5% NaHCO<sub>3</sub> (200 mL) and extracted with ethyl acetate (3 × 150 mL). The combined organic layers were dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated in vacuo leaving a crude yellow oil (4.00 g; 64 %). <sup>1</sup>H NMR (HCl salt, CD<sub>3</sub>OD) δ 3.02 (d, J = 6.83, 2H), 4.22 (t, J = 6.83, 1H), 5.15 (? , J = 3.93, 2H), 6.68 (d, J = 8.28, 1H), 6.91 (dd, J<sub>1</sub> = 8.28, J<sub>2</sub> = 2.18, 1H), 7.23-7.31 (m, 5H), 7.51 (d, J = 2.18, 1H).

PREPARATION OF X-2: The free base of X-1 (3.97 g, 10.0 mmol) was dissolved in dichloromethane (75 mL) and stirred at 0 °C under N<sub>2</sub>-atmosphere. Then, EDC (1.92 g, 10.0 mmol), HOBT (1.35 g, 10.0 mmol) and BOC-L-Phe (2.65 g, 10.0 mmol) were added simultaneously and triethylamine 1.39 mL, 10.0 mmol) was added dropwise. This reaction mixture was stirred for 15 h allowing to warm to ambient temperature. Ethyl acetate (200 mL) was added and the organic layer was washed with 5 % HCl (2 × 200 mL). The combined aqueous phases were extracted with ethyl acetate (100 mL) after which the combined organic layers were washed with 10% NaHCO<sub>3</sub> (100 mL). Drying (Na<sub>2</sub>SO<sub>4</sub>), filtration and evaporation in vacuo gave an off-white foam (6.01 g, 93%). The darkbrown reaction mixture was directly coated on silica gel and subjected to column chromatography (3 × 20 cm) eluting with chloroform. Pure fractions were pooled giving 2.45 g (62%) off-white solid after

PREPARATION OF EE-1: Triethylamine (3.37 mL; 24.2 mmol) was added to a solution of Q-2 (5.76 g; 12.1 mmol), 1,1'-bis(diphenylphosphino)ferrocene (0.400 g; 0.721

mmol) and palladium (II) acetate (0.0814 g; 0.362 mmol) in 25 mL DMF/10 mL benzyl alcohol. The reaction was placed under a CO atmosphere and heated to 60°C for 12 h. The reaction was diluted with EtOAc (75 mL), washed with 1 M HCl (3 x 25 mL), and dried (Na<sub>2</sub>SO<sub>4</sub>).
